PROJECT METHOD PLAYBOOK

DEVOPS

DevOps Service Reliability | synthetic baseline edition

Contents

1. Service Flow

2. Deployment Safety

3. Incident Learning

4. Reliability Signals

1 Service Flow

1.1 Evidence Inputs

DevOps teams align work to devops service reliability goals and record evidence before advancing the work item.

- Review the signal before changing the plan
- Keep ownership visible across handoffs

Stage	Evidence	Owner
Frame	Baseline	Lead
Test	Outcome	Team
Learn	Decision	Sponsor

2 Deployment Safety

2.1 Column Handoff

The DevOps method uses deployment safety to make the next decision observable and reversible.

Teams capture context, compare evidence, and assign a named owner for the next review.

Figure 1. Service signals move through a guarded deployment loop.

1. Evidence is sampled after a stable observation window.

3 Incident Learning

3.1 Assurance Measures

DevOps records a measurable result for incident learning and preserves the decision context.

Check	Threshold
Trace	Evidence linked
Review	Owner assigned
Close	Action recorded

4 Reliability Signals

A closeout record states what changed, who accepted the evidence, and what remains open in DevOps.
